Accuracy Defined Through Design

Now
with Carter's
patented ratchet
adjustment
system!

Set Screw

To adjust the travel*, loosen the set screw a half turn and ratchet the hook clockwise (as it appears in the diagram above) to *increase* the amount of travel, or counterclockwise to *decrease* the amount of travel. Each click is six degrees. After adjusting the hook, retighten the set screw and test the release by hooking a string to a stationary object and test-firing the release. Caution: if the hook is adjusted for insufficient travel, the release may fire prematurely and possibly cause damage.

**Travel refers to the degree the release must rotate in order to fire.*

Thumb Rest

Carter Enterprises recommends wrapping your thumb completely around the thumb rest, thus insuring the release is at the proper angle when drawing back. Note: if the release is not at the proper angle when drawing back, there is a chance the release will fire prematurely and may cause damage.

Recommended Use

The Atension Spike is a pure back-tension release. Once you are at full draw, push your bow hand towards the target and lightly pull your release hand back, thus firing the release in one smooth motion.
